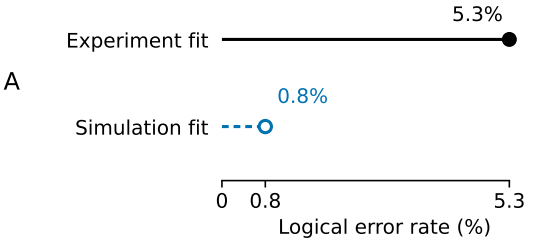
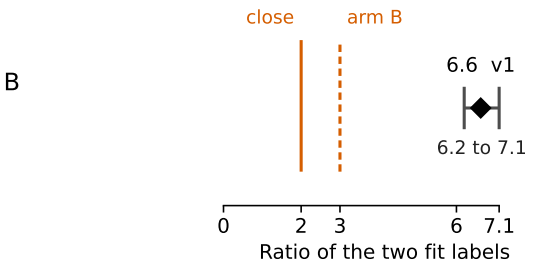
Grafted-code memory fits
and this note's two rules





A is the two exponential-fit labels on Fig. S22
of the v1 supplement. Length is the percent,
from zero. That caption does not say per cycle.
B is 5.3/0.8 = 6.6. The capped bar is only the
rounding span of the one-significant-figure 0.8%
(6.2 to 7.1). It is the published v1 ratio.
The rerun is read against same-run baseline B,
which need not equal 6.6.
Solid line at 2: an arm is closed when its upper
95% bound is below 2. Dashed line at 3: the run
counts only if B's lower 95% bound exceeds 3.
Both lines are rules set before any rerun.
No 2 by 2 arm has been run. A ratio of 1 is not
the target. This is not the factor-of-about-40
state-error comparison.
